Immunoaffinity purification, partial sequence, and subcellular
Incalization of rat liver phospholipase A2.";
I. J. Biol. Chem. 264:10008-10014 (1989).
C. - FUNCTION: Thought to participate in the regulation of the phospholipid metabolism in biomembranes including eicosanoid biosynthesis. Catalyzes the calcium-dependent hydrolysis of the 2-
C. CATALYTY: Phosphoglycerides.
C. - CATALYTY: Phosphoglycerides.
C. - CATALYTY: Phosphotholine + H (2)O = 1-
acylglycerophosphocholine + a fatty acid anion.
C. - CATALYTY: Binds i calcium ion per subunit (By similarity).
C. - SUBCELLULAR LOCATION: Membrane-associated.
C. - SUBCELLULAR LOCATION: Membrane-associated.
C. - MISCELLANBOUGS: Group II phospholipase A2 is found in many cells and also extracellularly. The membrane-bound and secreted forms are identical and are encoded by a single gene.
C. - SIMILARITY: Belongs to the phospholipase A2 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      This SWISS-PROT entry is copyright. J. Mol. Evol. 56:286-293(2003).

-!- FUNCTION: PA2 catalyzes the calcium-dependent hydrolysis of the 2-acyl groups in 3-en-phosphoglycerides.

-!- CATALYTIC ACTIVITY: Phosphatidylcholine + H(2)O = 1-acylglycerophosphocholine + a fatty acid anion.

-!- COFACTOR: Binds 1 calcium ion per subunit (By similarity).

-!- SUBCELLULAR LOCATION: Secreted (Probable).

-!- TISSUE SPECIFICITY: Expressed by the venom gland.

-!- TISSUE SPECIFICITY: Belongs to the phospholipase A2 family. Group II

Biochem. Blophys. Res. Commun. 251:613-619(1998).

-!- FUNCTION: Is not toxic by itself, but the synergistical mixture of vP7 and vP8 is lethal to mice (By similarity).

-!- SUBUNIT: Does not form a complex (By similarity).

-!- SUBCLIULAR LOCATION: Secreted (By similarity).

-!- SIMILARITY: Belongs to the phospholipase A2 family. Group II subfamily.

Toxicon 36:1155-1167(1998)
-1-FUNCTION: PA2 catalyzes the calcium-dependent hydrolysis of the 2 agyl groups in 3-sn-phosphoglycerides (By similarity).
-1-CATALYTIC ACTIVITY: Phosphatidylcholine + H(2)0 = 1-acylglycerophosphocholine + a fatty acid anion.
-1-CORACTOR: Binds 1 calcium ion [By similarity).
-1-SUBCELLULAR LOCATION: Secreted (By similarity).
-1-SUBCELLULAR LOCATION: Secreted (By similarity).

"Unusually high conservation of untranslated sequences in cDNAs for Trimerseaurus flavoviridis phospholipase A2 isozymes.";

Trimerseaurus flavoviridis phospholipase A2 isozymes.";

Proc. Natl. Acad. Sci. U.S.A. 89:8557-8561(1992).

-!- FUNCTION: PA2 catalyzes the calcium-dependent hydrolysis of the 2-acyl groups in 3-sn-phosphoglycerides.

-!- CTALLYIC ACTIVITY: Phosphatidylcholine + H(2)O.= 1-acylgycerophosphocholine + a fatty acid anion.

-!- COFACTOR: Binds 1 calcium ion per subunit (By similarity).

-!- SUBCELLULAR LOCATION: Secreted.

-!- SINGLIARITY: Belongs to the phospholipase A2 family. Group II

L. J. Biol. Chem. 273:3573-3582(1997).

L. GATALYTIC ACTIVITY: Phosphatidylcholine + H(2)O = 1- acylglycerophosphocholine + a fatty acid anion.

C. L. CATALYTIC Moreover or homodimer.

S. SUBCELLULAR LOCATION: Secreted.

L. SUBULER LOCATION: Secreted.

C. L. SIMILARITY: Belongs to the phospholipase A2 family. Group II
                                                                               Cho W., Tomasselli A.G., Heinrikson R.L., Kezdy F.J.;

The phospholipase A2 family.";

The phospholipase A2 family in the Paneth cells adjacent to the carrier A271 agroups in 3-sn-phospholipase A180 expressed in regenerating liver and hyperplastic esophageal epithelium.

The polymorphism causes a frameshift and premature truncation of the phospholipase A180 expressed in regenerating liver and hyperplastic esophageal epithelium.

The polymorphism causes a frameshift and premature truncation of the protein, rendering it inactive. Strains BALB/c, C3H/He, DBA/1, DBA/2, MRL and NZB/BIN contain the normal protein while strain CDATIONAL CANADANISTER.

The pholymorphism causes a frameshift and premature truncation of the protein, rendering it inactive. Strains BALB/c, C3H/He, DBA/1, DBA/2, MRL and NZB/BIN contain the normal protein while strain CATALTIONAL CANADANISTER.

A pharmaceutical composition comprising (I) is useful for treating or preventing viral and bacterial infections, and cancers. A pharmaceutical composition containing compounds capable of inhibiting catalytic activity of (I), biologically active compounds that bind sPLA 2 receptors, or a compound that modulates cell roliferation, cell migration, cell contraction or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 CCHAHDCCYGRLEKLGCEPKLEKYLFSVSERGIFCAGRTTCQRLTCECDKBAALCFRRNL 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 CCHAHDCCYGRLEKLGCEPKLEKYLFSVSERGIFCAGRTTCQRLTCECDKRAALCFRRNL 120
                                    antibacterial; immunosuppressive; antiinflammatory; tranquilliser; vulnerary; antiasthmatic; antiallergic; antirheumatic; and antiarchritic activity. The PLA2 protein, gene and an anti-PLA2 antibody are useful in the diagnosis of PLA2 associated diseases e.g. septic shock, adult respiratory distress syndrome, pancreatitis, trauma, bronchial asthma, allergic rhinitis and rheumatoid arthritis. The present sequence

apoptosis is useful for treating disease states or disorders involving group IIF sPLA2, such as inflammatory disease, cancers, cardiac and brain ischaemia, acute lung injury, acute respiratory distress syndrome or Crohn's disease. Specific antibodies are useful for searching new secreted mammalian group IIF SPLA2 or the homologues of the enzyme in other mammals. The encoding polymucleotides and vectors are useful for transforming animals and establishing a line of transgenic animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

and hydrolyses phosphatidylglycerol versus phosphatidylcholine with about a 15-fold preference. The mammalian secreted group IIF spLA2 protein or nucleic acid, or a pharmaceutical composition is useful for treating and/or preventing viral infections, bacterial infections, or cancers. The inhibitors of spLA2 or a composition comprising spLA2 inhibitors is useful for treating disease states or disorders involving group IIF sPLA2, e.g. inflammatory disease, cancer, cardiac and brain ischemia, acute lung injury, acute respiratory distress syndrome, or Crohn's compounds for treating these diseases. The amino acid sequence of human group IIE phospholipase A2 used to determine a consensus sequence of thuman spLA2s

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a mouse secretory type phospholipase A2 (PLA2) protein. The mouse secretory type PLA2-like protein can be used for screening in the development of inhibitors against the function of the protein. The present sequence represents mouse secretory type PLA2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention relates to human secretory phospholipase A2 (PLA2) protein and the gene encoding it. Inhibitors of phospholipase A2 have antibacterial; immunosuppressive; antihiflammatory; tranquilliser; vulnerary; antiasthmatic; antiallergic; antihreumatory; tranquilliser; vulnerary; antiasthmatic; antiallergic; antihreumatory; and antiarthritic activity. The PLA2 protein, gene and an anti-PLA2 antibody are useful in the diagnosis of PLA2 associated diseases e.g. septic shock, adult respiratory distress syndrome, pancreatitis, trauma, bronchial asthma, allergic rhintits and rheumatoid arthritis. The present sequence represents murine PLA2. The murine PLA2 gene sequence is used in the invention for the identification and characterisation of the human PLA2

The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antinifective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynuclectides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative

Clone lambda SPLA2cDNA-4 is one of four clones identified when probe oligo 2905 (AAN91257) was used to screen a cDNA library constructed from polyA+ message from a peritoneal cell RNA. It encodes the entire sPLA2 type A sequence which is given here. The mature peptide sequence (see FT) has a calculated molecular weight of 13,919 daltons. The same amino acid sequence is also encoded by the exors of clone lambda SPLA2-6 (AANN91260) in Figure 7. (Updated on 25-MAR-2003 to correct PA field.) (Updated on 25-MAR-2003 to correct PI
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mammalian synovial phospholipase A2 - used in food processing, design screening of inflammation inhibitors, as an anticancer drug or vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        5 LLLAVIMIFGLLQAHGNLVNFHRMIKLTTGKBAALSYGFYGCHCGVGGRGSPKDATDRCC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              엄
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The protein sequence was deduced from a DNA sequence obtd. from a genomic DNA library which was prepd. from a mutant fibroblast cell line which contains 5 copies of the X chromosome (GMSOD). The signal sequence is thought to be incomplete at the N-terminal since no promoter-like sequences are found in the DNA within 100 nucleo-tides 5' of this region. The deduced N-terminal sequence of the mature protein confirmed results obtd. by direct sequencing of the purified protein. This sequence creatls obtd. by direct sequencing of the purified protein. This sequence represents an amphibilic alpha-helix typical of PLA 2 mols. It has highly conserved lipophilic residues [e.g. Leu (22), Phe (25), and Ile (29)] and there is a cluster of beain amportant determinant in the interaction of PLA 2. There is a characteristic stretch of residues which comprises part of the calcium binding loop: Tyr(44)-G1y-Cys-X-Cys-G1y-C1y-X-X-X-Pro(56) and Asp(68). The conserved residues which constitute the active site (see features) are also present, and the constitute the active site (see features) are also present, and the constitute the active site (see features) are also present, and the constitute the active site (see features) are also present, and the constitute the active site (see features) are also present, and the constitute at the creaminal (The consensus sequence was determined from a comparisom of the consensus proposed to a constitute of the pure of a constitute of the consensus sequence was determined from a comparisom of the consensus sequence was determined from a comparisom of the consensus sequence was determined from a comparisom of the consensus sequence was determined from a comparisom of the consensus sequence was determined from a comparisom of the consensus sequence was determined from a comparisom of the consensus sequence was determined from a comparisom of the consensus sequence was determined to 25-MAR-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      63 HAHDCCYGRLEKLGCEPKLEKYLFSVSERGIFCAGRITCQRLTCECDKRAALCFRRNLGT 122

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Group IIF secreted phospholipase A2; sPLA2; phosphatidylglycerol; human; phosphatidylcholine; antibacterial; virucide; cytostatic; vasotropic; antinflammatory; vulnerary; cardiant; chromosome 1p35; transgenic;
                                                                                                                                                      A human cDNA (AAQ81138) expressing a novel PLA2, HPLA2-10, was derived from human brain RNA by RACE-PCR. HPLA2-10 (AAR63046) was characterized as a novel type of PLA2, type IV, on the basis of its Cys content in comparison with human PLA2 types I (AAR63054) and II (AAR63055) (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a mammalian secreted group IIF secreted phospholipase A2 (sPLA2) (I), where the enzyme is Ca2+ dependent, maximally active at pH 7-8 and hydrolyzes phosphatidylglycerol versus
                                                                                                                                                                                                                                                                                                                                                                                                       GNLVQFGVMIEKMTGK-SALQYNDYGCYCGIGGSHWPVDQTDWCC

                                                                                                                                                                                                                                                          This sequence is encoded by the phospholipase A2 (PLA2) CDNA. The CDNA was amplified using the primer sequences given in AAQ26370-1 by PCR from a human lung cDNA library. The CDNA sequence was used in the construction of an expression vector which further comprised a promoter and a dominant control region. This vector was used in an expression system comprising a mammalian cell transformed with the vector. This expression system could be used to prepare pharmacologically useful polypeptides eg, human growth hormone (HGH), granulocyte-colony stimulating factor (G-CSF) and PLA2, and for gene therapy. The mammalian host comprises erythroid cells and a heterologous promoter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      122

phosphatidylcholine with a 15-fold preference. A pharmaceutical composition comprising (I) is useful for treating or preventing viral and cancers. A pharmaceutical composition containing capable of inhibiting catalytic activity of (I), biologically active compounds that bind sPLA. receptors, or a compound a population of that modulates cell roliferation, cell migrafion, cell contraction or apoptosis is useful for treating disease states or disorders involving group IIF sPLA2, such as inflammatory disease, cancers, cardiac and brain changes a cut clung injury, acute respiratory distress syndrome or changes specific antibodies are useful for searching new secreted mammalian group IIF sPLA2 or the homologues of the enzyme in change and mammals. The encoding polymucleotides and vectors are useful for transforming animals and establishing a line of transgenic animals. Sequences ABR4432-238 represent various human secreted sPLA2 enzymes used in alignment studies with the GIFF sPLA2 enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 144 AA;

New compound that hybridizes with and inhibits the expression of Phospholipase A2, group IIA, useful for preparing a composition for treating or preventing inflammation, cancer, psoriasis or diabetes.

Example 13; Page 95-96; 135pp; English.

```
The present invention describes a compound (I) comprising 8-50 nucleobases which is targeted to a 5' untranslated region (UTR), coding, 2' UTR or intron region of a nucleic acid molecule encoding phospholipase A2 group IIA (synovial), where the compound specifically hybridises with and inhibits the expression of phospholipase A2, group IIA (synovial).

CC Also described: (1) a composition comprising the compound and a carrier or diluent; (2) a method of inhibiting the expression of phospholipase A2, group IIA in cells or tissues; and (3) a method of treating an animal hazase or condition associated with phospholipase A2, group IIA (synovial). (1) has antinflammatory, antidiabetic, cytostatic and antipsoriatic activities, and can be used in vaccines and in gene antipsoriatic activities, and can be used for preparing a composition for treating or preventing inflammation, cancer, psoriasis or diabetes. The present sequence represente human phospholipase A2 group IIA (synovial), which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2

New mammalian secreted group IIF phospholipase A2 or nucleic acid, useful for treating or preventing viral or bacterial infections, or cancers, or screening inhibitors of the enzyme for treating e.g. inflammatory

```
The invention relates to newly discovered cancer markers associated with the cancerous state of prostate cells. Also disclosed is a method of assessing whether a patient is afflicted with prostate cancer. The method of the invention involves assessing whether a patient is afflicted with prostate cancer by comparing the level of expression of a marker in a control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level of expression of the marker in the patient sample and the normal control non-prostate cancer sample, where a significant increase in the level of expression of the marker in the patient sample and the normal level indicates that the patient is afflicted with prostate cancer.

Nucleic acids of the invention are useful for diagnosing or treating prostate cancer, and may be useful in gene therapy. Sequences given in ADB75177-ADB7531 represent marker cDNA and proteins. Note: The sequence of data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the print of the prin

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              7
                                                                                            The invention describes a mammalian secreted group IIF phospholipase A2 (sPLA2), which is Ca2+-dependent, maximally active at pH of about 7-8, and hydrolyses phosphatidyledline with about a 15-fold preference. The mammalian secreted group IIF sPLA2 protein or mucleic acid, or a pharmaceutical composition is useful for treating and/or preventing viral infections, bacterial infections, or cancers. The inhibitors of splan are composition comprising spla2 inhibitors is useful for treating disease states or disorders involving group IIF sPLA2, e.g. inflammatory diseases, cancer, cardiac and brain ischaemia, acute lung injury, acute respiratory distress syndrome, or Crohn's disease. The enzyme is also useful for screening various chemical compounds for treating these diseases. This is the amino acid sequence of them are group IIA phospholipase A2 used to determine a consensus sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              63 HAHDCCYGRLEKIGCEPKLEKYLFSVSERGIFCAGRITCQRLTCECDKRAALCFRRNLGT 122

preparing a medicament for treating pain in an animal

Claim 1; Page; 1017pp; English.

The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in meuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a compound that regulates the activity of one or more of the polynucleotides or their antibodies. The polynucleotide or the compound that compound that compound useful in treating pain and a pharmaceutical composition compound useful in treating pain and apharmaceutical for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (CII) and spared nerve injury (MIN) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is patent did not form pair of the printed specification, but was obtained in electronic form directly from wipp at the way obtained in electronic form directly from wipp at the way of the sequences.

phospholipase A2 (EC 3.1.1.4) ammodytin 12 precursor - wes
C;Species: Vipera ammodytes ammodytes (western sand viper)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A,Status: preliminary
A,Molecule type: protein

A.Molecule type: protein
A.Residues: 1-123 - WELD.
A.Residues: 1-123 - WELD.
A.Roperimental source: venom
A.Note: sequence extracted from NCBI backbone (NCBIP:132046)
C.Superfamily: phospholipase
C.Steywords: carboxylic ester hydrolase
F;47,89/Active site: His, Asp #status predicted

A, Molecule type: protein
A, Molecule type: protein
C, Function: catalyzes hydrolysis of 1,2-diacyl-sn-glycero-3-phosphocholine to 1-acyl-A, Mole: the reaction is strongly enhanced when the phospholipid is condensed into a mice
C, Superfamily: phospholipase A2
C, Keywords: calcium; catboxylic ester hydrolase; homodimer; lipid degradation; metallopz
F, 27, 29-44, 41-95, 49-115, 50-88, 57-81, 75-86, Disulfide bonds: #status predicted
F, 27, 29, 31, 48, Binding site: calcium (Tyr, Gly, Gly, Gly, Asp) #status predicted
F, 47, 89/Active site: His, Asp #status predicted
A, Description: catalyzes hydrolysis of 1,2-diacyl-sn-glycero-3-phosphocholine to 1-acyl-A,Note: the reaction is strongly enhanced when the phospholipid is condensed into a mice C; Superfamily: phospholipase A2 (**Symperfamily: phospholipase A2 (**Symperfamily: phospholipase A2 (**Symperfamily: arboxylic ester hydrolase; lipid degradation; metalloprotein; pres F; 25-121, 27-43, 42-94, 48-149-87, 56-80, 74-85/Disulfide bonds: #status predicted F; 26, 28, 30, 47/Binding site: calcium (Tyr, Gly, Gly, Asp) #status predicted F; 46, 88/Active site: His, Asp #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         phospholipase A2 (EC 3.1.1.4) X - habu
NyAlternate names: phosphatidylcholine 2-acylhydrolase
C;Species: Trimeresurus flavoviridis (habu)
C;Species: Trimeresurus flavoviridis (habu)

J. C. Province in J. Phospholipae in the regulation of the phospholipid metabolism in biomembranes including eicosanoid biosynthesis: Catalyzes the calcium-dependent hydrolysis of the 2-acyl groups in 3-an-phospholycerides.

J. C. CATALYTIC ACTIVITY: Phosphatidylcholine + H(2)O = 1-acylglycerophosphocholine + a fatty acid anion.

J. COFACTOR: Binds I calcium ion per subunit.

J. SUBCELLULAR LOCATION: Membrane-associated.

J. MISCELLULAR LOCATION: Membrane-associated.

J. MISCELLULAR LOCATION: Membrane-bound and secreted forms are identical and are encoded by a single gene.

J. SIMILARITY: Belongs to the phospholipase A2 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            X.-RAY CRYSTALLOGRAPHY (2.2 ANGSTROMS).

"Purification and characterization of a phospholipase A2 from Cerastes cerastes (horn viper) snake venom.";
Toxicon 28:637-646(1990).
-!- FUNCTION: PA2 catalyzes the calcium-dependent hydrolysis of the 2-acyl groups in 3-sn-phosphoglycerides.
-!- CATALYTIC ACTIVITY: Phosphatidylcholine + H(2)0 = 1-acylglycerophosphocholine + afatty acid anion.
-!- COFACTOR: Binds 1 calcium ion per subunit (By similarity).
-!- SUBCELLULAR LOCATIVIN: Secreted.
                                                                                                MEDLINE=91130587; PubMed=1993470;

J. Biochem. 204:1057-1062(1992).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Submitted (JAN-1995) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: PA2 catalyzes the calcium-dependent hydrolysis of the caryl groups in 3-sn-phosphoglycerides.

-!- CATALYTIC ACTIVITY: Phosphatidylcholine + H(2)O = 1-
acylglycerophosphocholine + a fatty acid anion.

-!- CORACTOR: Binds I calcium ion per subunit (By similarity).

-!- SUBCELLULAR LOCATION: Secreted.

-!- SIMILARITY: Belongs to the phospholipase A2 family. Group II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Kordis D., Gubensek F.;
"Molecular evolution of phospholipase A2 multigene family in Vipera
                                                                                                                                                                 Vipera ammodytes ammodytes (Western sand viper).

Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

Epidosauria; Squamata; Scleroglossa; Serpentes; Colubroidea;

Viperidae; Viperinae; Vipera.

CC "I FUNCTION THOUGH to participate in the regulation of the phospholipid metabolism in biomembranes including eicosanoid biosynthesis. Catalyzes the calcium-dependent hydrolysis of the 2-carl groups in 3 sn-phospholipine + H(2)0 = 1-carl groups in 3 sn-phospholine + a fatty acid anion.

CC "I CARALYTIC ACTIVITY: PhosphatidyLcholine + CC acyl groups in 3 sn-phospholipine + a fatty acid anion.

CC "I CARALYTIC ACTIVITY: PhosphatidyLcholine + CC acyl groups in Calcium ion per subunit (By similarity).

CC "I CARCELLANBOUS: Group II phospholipase A2 is found in many cells and also extracellularly. The membrane-bound and secreted forms are identical and are encoded by a single gene.

CC "I SIMILARITY: Belongs to the phospholipase A2 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Hayakawa M., Horigome K., Kudo I., Tomita M., Nojima S., Inoue K.; "Amino acid composition and NH2-terminal amino acid sequence of rat platelet secretory phospholipase A2."; J. Blochem. 101:1311-1314(1987).

J. Mol. Evol. 56:286-293(2003).

J. Mol. Evol. 56:286-293(2003).

J. CALTALTIC SALE ACTIVITY: Phosphacidy. The calcium dependent hydrolysis of to capaly groups in 3-sn-phosphoglycerides.

J. CARALTIC ACTIVITY: Phosphacidy. H(2)0 = 1-acyl groups in 9-sn-phospholine + H(2)0 = 1-cacyl groupsphospholine + a fatty acid anion.

J. COFACTOR: Binds 1 calcium ion per subunit (By similarity).

J. SURGELBULAR LOCATION: Secreted (Probable).

J. TISSUE SPECIFICITY: Expressed by the venom gland.

J. SIMILARITY: Belongs to the phospholipase A2 family. Group II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Chijiwa T., Yamaguchi Y., Ogawa T., Deshimaru M., Nobuhisa I., Nakashima K.-I., Oda-Ueda N., Pukumaki Y., Hattori S., Ohno M.; "Interisland evolution of Trimeresurus flavoviridis venom

-1. FUNCTION: PA2 catalyzes the calcium-dependent hydrolysis of the 2-acyl groups in 3-sn-phosphoglycerides (By similarity).
-1. CATALYTIC ACTIVITY: Phosphatidylcholine + H(2)0 = 1-acylglycerophosphochline + a fatty acid anion.
-1. COFACTOR: Binds 1 calcium ion per subunit (By similarity).
-1. SUBCELLULAR LOCATION: Secreted (By similarity).
-1. TISSUE SPECIFICITY: Expressed by the venom gland (Probable).
-1. SIMILARITY: Belongs to the phospholipase A2 family. Group II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Probom; PD000103; PhospholipaseA2; 1.

-!- FUNCTION: PAZ catalyzes the calcium-dependent hydrolysis of the 2-acyl groups in 3-sn-phosphoglycerides. Displays edema-inducing activities. PLA-A is three times less active than PLA-B in edema-

--- CATALYTIC ACTIVITY: Phosphatidylcholine + H(2)0 = 1-
acyldlycerophosphocholine + a fatty acid anion.
--- COFACTOR: Binds 1 calcium ion per subunit (By similarity).
--- SUBCELLULAR LOCATION: Secreted.
--- INSUE SPECIFICITY: Expressed by the venom gland.
--- SIMIGARITY: Belongs to the phospholipase A2 family. Group II

GENERAL INFORMATION:

APPLICANT: Tiscpffeld, Jay A.

APPLICANT: Tiscpffeld, Jay A.

APPLICANT: Sethamer, Jeffrey

TITLE OF INVENTION: Mammalian Phospholipase A2 Nucleotide

TITLE OF INVENTION: Bequences and Low Molecular Meight Amino Acid Sequences

TITLE OF INVENTION: Bequences and Nucleotide

TITLE OF INVENTION: Sequences Naving Internal Ribosome Binding Sites

NUMBER OF SEQUENCES: 44

CORRESPONDENCE ADDRESS:

ADDRESSEE: Ruden, Barnett, McClosky, Smith, Schuster &

ADDRESSEE: Russell PA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1,

Sequence 37, Application US/0888497

Patent No. 5972677

GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: Tischfield, Jay A.

APPLICANT: Seilhamer, Jeffrey J.

TITLE OF INVENTION: Mammalian Phospholipase A2 Nucleotide

TITLE OF INVENTION: Sequences and Low Molecular Weight Amino Acid Sequences

TITLE OF INVENTION: Sequences Having Internal Ribosome Binding Sites

NUMBER OF SEQUENCES: 44

CORRESPONDENCE ADDRESS:

ADDRESSEE: Ruden, Barnett, McClosky, Smith, Schuster & ADDRESSEE: Russell PA
                                                                                                                                                                                                                                              ä

GENERAL INFORMATION:
APPLICANT: Tischfield, Jay A.
APPLICANT: Tischfield, Jay A.
APPLICANT: Seilhamer, Jeffrey J.
TITLE OF INVENTION: Mammalian Phospholipase A2 Nucleotide
TITLE OF INVENTION: Sequences and Low Molecular Weight Amino Acid Sequences
TITLE OF INVENTION: Sequences Having Internal Ribosome Binding Sites
TITLE OF INVENTION: Sequences Having Internal Ribosome Binding Sites
NUMBER OF SEQUENCES: 44
CORRESPONDENCE ADDRESS:
ADDRESSEE: Ruden, Barnett, McClosky, Smith, Schuster &
ADDRESSEE: Russell PA
STREET: 200 East Broward Boulevard
CITY: Fort Lauderdale
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 TKFVTYKFSYRGGQISCSTNQDSCRKQLCQCDKAAAAECFARNKKSYSLKYQFYPNKFCKG 120
